

APPENDIX A

```

c      A model of a ringdown signal with noise is created to mimic
c      experimental data obtained from
c      a photodetector and preamplifier applied to an A to D convertor.
c      It is then fit with the new algorithm that subtracts a line
c      that is fit to the background before applying the standard
c      algorithm and compares that fit with one that simply uses a
c      constant for baseline subtraction. We use exponential decays
c      of tau=80 microseconds, choose a peak signal, add gaussian noise,
c      add a dc offset then add sixty Hz noise. As in real experiments
c      the data is sampled every microsecond.
c      Then use one iteration of nonlinear fit and compare.

c      ( Note: Fortran 77, with a few exceptions, is used. One exception
c      which is machine specific is the open statement. As an example open
c      (39,file='',status='new'). The file name which is left
c      blank allows its insertion at run time.) The text that follows an "!"
c      is a comment and not part of the source code.

APPENDIX B

This is the compiled results using 500 independent ringdowns with the rms 60 Hz = to the gaussian rms white noise. As you can see, as indicated at the bottom of the table, the squared ratio of the ensemble sigma tau is 19.77. That ratio shows that to achieve a given precision in tau, one needs 19.77 times as much averaging using the standard algorithm compared with the new one. We have repeated this run 10 times to develop a statistic on the improvement for this set of parameters and the result was that the average improvement was 18.98 with a sdev = 1.42. As you might expect, if the 60 Hz signal gets smaller, the improvement also gets smaller. However, the significance of the result is that the time taken to make a measurement of a given precision is reduced by that ratio. (This is the output of the source code with one item that I added subsequently , the "gauss rms = 3.5).

The chosen values are:

random seed = 1 ,amp = 800.000 60Hz-rms = 3.50000 offset = 10.0000 tau = 80.0000 gauss rms = 3.5

average tau = 80.1321 sigma tau = 0.877687 average red chisq = 1.09949

average amp = 799.267 sigma amp = 1.00279

the squared ratio of sigma tau for the two data sets = 19.7766
